Τſ - Decorative sheet prodn. - involves printing paper with free-radical polymerisable ink, coating with UV-polymerisable varnish etc. (J5 12.12.75)

- J82003504 The method comprises printing decorative design on thin paper of AB density of 17-30 g/sq.m with free-radical polymerisable ink, coating the paper with varnish capable of free radical polymerising by UV excitation, curing the coating by exposure to light of wavelength corresp. to resonance region of the free radical, and bonding the decorative paper to base sheet.
